# Twitter Sentiment Prediction Python Package

---

This project focuses on predicting the sentiment of Twitter posts using Natural Language Processing (NLP) techniques. It is an end-to-end machine learning project that includes data preprocessing, model building, hyperparameter tuning, and deployment.

---

## How I built this package

---

[Download code packaging process.pdf](#)

## Features

---

- **ETL Pipeline:** Extract, transform, and load (ETL) processes implemented using PySpark and SQL.
  - **Text Processing:** Cleaned text data using regex, removed special characters, and vectorized text using TF-IDF.
  - **Model Building:** Implemented Logistic Regression and Multinomial Naive Bayes for sentiment prediction.
  - **Hyperparameter Tuning:** Optimized models using GridSearchCV.
  - **Experiment Tracking:** Logged experiments with MLflow for efficient performance comparison.
  - **Model Packaging:** Prepared reusable model packages using `sdist` and `wheel`.
  - **Deployment Ready:** Plan to host the project on Render for public access.
- 

## Installation

---

1. Clone the repository:

```
bash git clone https://github.com/vijaytakbhate2002/sentiment_prediction_python_package.git
```
  2. Install the package using pip:

```
bash pip install git+https://github.com/vijaytakbhate2002/sentiment_prediction_python_package.git
```
- 

## Usage

---

### Prediction Example

---

To predict the sentiment of a Twitter post, you can use the following Python code:

```
from sentiment_prediction import predict
predict.predictor("this is a negative tweet")
```

This will return:

```
[ 'Negative' ]
```

### Sentiment Classes

---

The prediction function supports four sentiment classes:

- **Positive**

- Negative
- Neutral
- Irrelevant

---
